

DASHBOARD WALKTHROUGH

PhonePe Transaction Analytics Dashboard

Power BI Business Intelligence Solution

Field	Details
Prepared by	Akash Gahlot
Role	Business Analyst / BI Analyst
Tool	Microsoft Power BI
Version	1.0
Date	August 2026
Status	Final

Portfolio Documentation

A practical guide to navigating and interpreting the PhonePe-themed transaction analytics dashboard. This document is not an official internal PhonePe document.

1. Purpose of This Guide

This walkthrough explains how the Power BI dashboard is structured, how each section should be interpreted, and how business users can use filters and visuals to investigate transaction performance.

The guide is designed for business stakeholders, analysts, recruiters, and interviewers who want to understand the dashboard without opening the Power BI file.

2. Dashboard at a Glance

Dashboard Area	Purpose
KPI Cards	Executive summary of transaction performance
Transaction Trend	Analyze transaction movement over time
Age Segment	Understand customer contribution
Service Value	Compare transaction value across services
Top 5 Users	Identify high-value users
Weekday / Weekend	Analyze usage timing
Month Filter	Perform period-specific analysis
Payment Status	Analyze successful, pending, and failed outcomes
Insights	Communicate key observations

The dashboard is designed as an interactive analytical layer: users begin with the overall KPI view and then drill into trends, segments, services, users, and transaction outcomes using filters.

3. Dashboard Layout Guide

Dashboard Section	What the User Can Do
Section A — Executive KPIs	Top-level transaction and user performance.
Section B — Transaction Trend	Time-based transaction activity and growth.
Section C — Customer Segmentation	Age-segment contribution.
Section D — Service Analysis	Transaction value by service category.
Section E — High-Value Users	Top 5 users ranked by transaction value.
Section F — Usage Pattern	Weekday versus weekend distribution.
Section G — Filters	Month and Payment Status controls.
Section H — Insights	Concise observations derived from dashboard data.

4. KPI Walkthrough

KPI	Displayed Value	Business Interpretation
Total Transactions	300K	Shows overall transaction volume represented in the dashboard.
Total Transaction Value	■3.47B	Shows the total monetary value represented by the dashboard data.
Unique Users	108K	Shows the distinct user population represented in the analysis.
Successful Rate	96.00%	Shows the displayed share of transactions classified as successful.
Transaction MoM Growth	8.97%	Shows the displayed month-over-month change in transaction volume.
Transaction Value MoM Growth	8.98%	Shows the displayed month-over-month change in transaction value.

How to use the KPI layer

Start with the KPI cards to establish the overall performance context. Then use the trend, service, customer, and payment-status views to understand what is happening behind those headline numbers.

5. Transaction Trend Walkthrough

The transaction trend visual provides a time-based view of transaction activity. It is intended to help users identify periods of higher or lower activity and place the MoM growth KPIs into context.

How to read it

- Review the overall direction of the trend.
- Look for noticeable increases or decreases between periods.
- Use the Month filter to focus on a particular period.
- Compare the filtered view with the overall dashboard state.
- Use the MoM KPIs as supporting context rather than interpreting a single period in isolation.

6. Customer Segment Walkthrough

The Age Segment Contribution visual compares the displayed contribution of four age groups. These percentages represent the project dashboard's displayed data and should not be treated as official PhonePe customer statistics.

Age Segment	Contribution
Gen X	37.4%
Millennials	37.3%
Gen Z	20.74%
Boomers	4.56%

The visual shows Gen X as the largest displayed segment, closely followed by Millennials. This view can support customer-segmentation discussions and prioritization of further analysis.

7. Service Analysis Walkthrough

The Service Transaction Value visual compares transaction value across service categories. It helps users understand how the displayed transaction value is distributed across different services.

Service	Approx. Dashboard Value
Loans	■2.5B
Insurance	■0.5B
Money Transfer	■0.4B
Recharge Bills	■0.1B

How to use the visual

- Compare the relative value of each service.
- Identify the highest-value category.
- Review lower-value categories for portfolio comparison.
- Use filters, where applicable, to investigate the dashboard state for a selected period or payment outcome.

Loans represent the largest displayed service transaction value in the supplied dashboard. The values are portfolio-project outputs, not official PhonePe corporate metrics.

8. Top 5 Users Walkthrough

The Top 5 Users visual ranks users by transaction value. It is intended to help analysts understand concentration among the highest-value users represented in the dataset.

Rank	User	Transaction Value
1	Michael Smith	■1.8M
2	Jennifer Williams	■1.6M
3	Michael Brown	■1.3M
4	Christopher Brown	■1.2M
5	Michael Jones	■1.2M

The ranking is a data-analysis view only. No personal characteristics or behavioral explanations should be inferred from the names or transaction values.

9. Weekday vs Weekend Walkthrough

Usage Period	Displayed Share
Weekday	71.6%
Weekend	28.4%

The displayed data shows a higher weekday share than weekend share. The visual can support operational planning and engagement analysis, but it does not establish why the difference exists.

10. Payment Status Filter Walkthrough

The Payment Status slicer allows users to focus the dashboard on transaction outcomes.

1. **Locate the filter.** Find the Payment Status control on the dashboard.
2. **Select a status.** Choose Successful, Pending, or Failed.
3. **Review the dashboard.** Observe changes to applicable KPIs and visuals.
4. **Compare.** Compare the filtered state with the overall view.
5. **Clear.** Remove the selection to return to the overall dashboard.

Business use

This interaction supports focused payment-outcome analysis. It does not perform root-cause analysis of failed payments unless that information is separately available in the underlying data.

11. Month Filter Walkthrough

1. Locate the Month filter.
2. Select the required month.
3. Review updated KPI values.
4. Review the transaction trend for the selected period.
5. Review applicable service, user, and outcome visuals.
6. Clear the selection to return to the overall view.

The Month filter is particularly useful when comparing a specific period with the dashboard's overall performance.

12. Combined Filter Analysis

Month and Payment Status can be combined to create a focused analytical view.

Scenario	Analysis Approach
Scenario 1	Select a month + Successful to examine the dashboard's successful-transaction view for that period.
Scenario 2	Select a month + Failed to investigate the displayed failed-transaction view for that period.
Scenario 3	Select a month + Pending to review transactions shown as pending during that period.
Scenario 4	Clear both filters to return to the full dashboard context.

The exact filtered results should always be read from the dashboard after the selections are applied; this guide does not invent filtered values that are not visible in the supplied dashboard.

13. Business Analysis Scenarios

Scenario	Recommended Dashboard Flow
Executive Performance Review	KPI Cards → Transaction Trend → Successful Rate → MoM Growth
Service Performance Analysis	Service Value → Compare categories → Review Total Value
Customer Segment Analysis	Age Segment → Compare contribution → Identify largest segment
Payment Performance Analysis	Payment Status → Select outcome → Review applicable KPIs and visuals
Period Analysis	Month → Select period → Review KPIs → Trend → Supporting visuals

14. Key Dashboard Insights

- Total transactions displayed: 300K.
- Total transaction value displayed: ■3.47B.
- Unique users displayed: 108K.
- Successful rate displayed: 96.00%.
- Loans represent the largest displayed service transaction value category.
- Gen X has the largest displayed age-segment contribution at 37.4%.
- Millennials are closely behind at 37.3%.
- Weekday usage is higher than weekend usage in the displayed data.
- Transaction MoM growth displayed: 8.97%.
- Transaction value MoM growth displayed: 8.98%.

15. Using the Dashboard for Decision-Making

Stakeholder	Useful Dashboard Areas
Business Leadership	KPI cards, transaction trend, successful rate, MoM growth
Business Analysts	Filters, trends, segmentation, service analysis
Operations	Payment Status and transaction outcomes
Product Teams	Service Transaction Value
Customer / Marketing Teams	Age Segment and Top 5 Users

16. Dashboard Best Practices

- Start with the KPI cards before drilling into individual visuals.
- Review the overall trend before applying filters.
- Apply one filter at a time when investigating an issue.
- Combine Month and Payment Status for focused analysis.

- Compare filtered results with the overall view.
- Use multiple visuals together rather than relying on a single KPI.
- Treat displayed percentages and values as contextual project metrics.
- Avoid making causal claims that are not supported by the dataset.

17. Limitations

- The dashboard is based on the supplied portfolio dataset.
- It is not a real-time payment monitoring system.
- It does not perform payment authorization or transaction processing.
- It does not provide a fraud-detection system.
- It does not automatically identify the root cause of failed transactions.
- Filtered scenario results must be interpreted using the available data.
- The project is intended for portfolio and analytical demonstration purposes.
- The dashboard should not be presented as official internal PhonePe reporting.

18. Quick Reference

If You Need To...	Use This Dashboard Area
Understand overall performance	KPI Cards
Analyze transaction movement	Transaction Trend
Understand customer contribution	Age Segment
Compare services	Service Transaction Value
Identify high-value users	Top 5 Users
Analyze usage timing	Weekday / Weekend
Analyze a period	Month Filter
Analyze payment outcomes	Payment Status Filter
Review main findings	Insights Section

19. Conclusion

The PhonePe Transaction Analytics Dashboard provides an interactive business intelligence experience for understanding transaction volume, transaction value, user activity, customer segmentation, service performance, payment outcomes, and usage patterns.

By combining executive KPIs with interactive filters and analytical visuals, the dashboard enables users to move from a high-level performance view to focused investigation. The walkthrough provides the context needed to use the dashboard effectively and interpret its outputs responsibly.

Appendix — Dashboard Reference Values

The following values are reproduced from the supplied dashboard view and are used throughout this walkthrough:

Metric	Displayed Value
Total Transactions	300K
Total Transaction Value	■3.47B
Unique Users	108K
Successful Rate	96.00%
Transaction MoM Growth	8.97%
Transaction Value MoM Growth	8.98%
Gen X	37.4%
Millennials	37.3%
Gen Z	20.74%
Boomers	4.56%
Weekday	71.6%
Weekend	28.4%
